Fact Sheet 2025

ORIP'S MISSION

ORIP advances the National Institutes of Health (NIH) mission by supporting infrastructure for innovation. This support is focused on research resources, including animal models for human diseases, cutting-edge scientific instrumentation, construction and modernization of research facilities, and research training opportunities for veterinary scientists. Through continued engagement with NIH institutes, centers, and offices and the biomedical research community, ORIP empowers and expands existing programs and develops new initiatives to support NIH research at the forefront of scientific progress.

OVERVIEW

The Division of Comparative Medicine (DCM) within the Office of Research Infrastructure Programs (ORIP), Division of Program Coordination, Planning, and Strategic Initiatives (DPCPSI), Office of the Director, NIH, advances biomedical research by supporting research resources, such as those that provide animal models for human disease.

Because of their genetic, anatomical, physiological, and behavioral similarities to humans, nonhuman primates (NHPs) are one of the best models for human disease research when studies in humans are not feasible. Among other important medical advances, NHPs have played key roles in understanding and treating a variety of chronic diseases. For example, NHPs have been critical to the advancement of therapeutics for type 2 diabetes and other metabolic disorders, the treatment

of glioblastoma (brain cancer), deep-brain stimulation to treat Parkinson's disease, neuroprosthetics (including decoding of brain waves for brain-machine interfaces), pain management interventions, and organ transplantation. NHP research helps determine the safety and efficacy of devices and therapies before they are used in humans.

Costs related to stringent breeding and housing requirements limit access to NHPs throughout the biomedical research community. To mitigate these issues, ORIP's DCM supports multiple NHP facilities and research-related resources that are available to the community of NIH-funded researchers. These NHP resources contribute to biomedical research spanning scientific disciplines, with studies supported across almost all NIH institutes, centers, and offices.

NONHUMAN PRIMATE RESOURCES

National Primate Research Centers

The [National Primate Research Centers \(NPRCs\)](#) are a national network of seven Centers that

increase access to and promote sharing of valuable NHP-related resources among biomedical researchers. Additionally, the NPRCs advance the missions of NIH institutes, centers, and offices by providing the animals, facilities, expertise, and resources required by investigators in disease areas. ORIP's DCM funds NPRCs located in California, Georgia, Louisiana, Oregon, Texas, Washington, and Wisconsin. Collectively, the NPRCs maintain breeding colonies for rhesus, pigtail, and Japanese macaques; common marmosets; olive baboons; and titi monkeys.

Each Center provides expertise on the use of various NHP species as models for human disease in specific research projects. Each provides a variety of services, both individually and through inter-NPRC collaborations. The NPRCs provide services for research funded by NIH, other federal agencies, nonprofit foundations, and the private sector. Additionally, the NPRCs offer a Pilot Research Program that supports new investigators and exploratory research, as well as a Visiting Scientist Program that offers advanced research training. The NPRCs have scientific programs addressing major research fields, including chronic diseases, aging, cardiovascular disease, diabetes and metabolic disorders, neuroscience, pediatrics, regenerative medicine, reproductive health, and obesity. For detailed information on NPRC capabilities, advances, and programs, visit nprc.org.

Specific-Pathogen-Free Macaque Colonies

Macaque monkeys are premier research models for HIV/AIDS. For example, macaques infected with the simian immunodeficiency virus (SIV)—the NHP analogue of HIV—are used to address basic research questions about viral infection routes, acute phases of infection, and latent viral reservoirs because these cannot be studied directly in humans. Likewise, SIV-infected macaques serve as models for developing HIV vaccines, infection prevention devices, new therapeutics, microbicides, and cure strategies prior to first-in-human trials.

The presence of specific viral pathogens in experimental animals can confound the results of HIV/AIDS-related investigations or pose a health risk to staff. Therefore, a consortium of colonies was developed to provide specific-pathogen-free (SPF) macaques for AIDS research that are negative for SIV, type D simian retrovirus, simian T-cell lymphotropic virus, and herpes B virus. Additionally, SPF macaques are characterized for major histocompatibility complex class I alleles, which are known to be associated with SIV viral load and rate of disease progression. ORIP supports SPF rhesus macaque colonies at the California, Emory, Oregon, Southwest, and Tulane NPRCs, as well as the Caribbean Primate Research Center in Puerto Rico. ORIP also supports SPF pigtail macaque colonies at the

Washington NPRC and The Johns Hopkins University School of Medicine. Visit the [ORIP website](#) for more details on these critical SPF macaque resources.

Other Nonhuman Primate Research Resources

Baboon Research Resources: Relative to most other NHP models, baboons are most similar to humans in terms of their larger size, year-round breeding, and placental biology. Due to similarities between baboon and human immune systems, baboons are critical for vaccine development, xenotransplantation, and studies of inflammation and bacterial sepsis. The [baboon colony](#) at The University of Texas MD Anderson Cancer Center’s Michale E. Keeling Center for Comparative Medicine and Research (KCCMR) is maintained free of infection from an extensive list of at least 18 viruses, bacteria, and parasites and is a valuable research resource for studies requiring the unique similarities of baboons to humans without the complicating influences of coinfections. A baboon colony also is located at the Southwest NPRC.

Squirrel Monkey Breeding and Research Resource:

Housed at KCCMR, this is the only national [squirrel monkey](#) breeding and research resource available for biomedical research and one of the few NIH-supported national research resources that specialize in a New World (neotropical) primate species. Squirrel monkeys are valuable for neuroscience research due to their small size and similarities to humans in brain structure, which makes them superior neuroscience models compared with small nonprimate mammals, such as rodents. Squirrel monkeys are used in a variety of NIH-supported research programs, including those focused on aging, immune therapies in the treatment of Alzheimer’s disease and related dementias, neuroscience, vision, drug addiction, and substance use.

Caribbean Primate Research Center: The [Caribbean Primate Research Center \(CPRC\)](#) maintains conventional and SPF macaque colonies. Additionally, the CPRC maintains a free-ranging colony of rhesus macaques of purely Indian origin that was established more than 80 years ago from a substantial founder population. This colony exhibits the lowest levels of genetic admixture with non-Indian-origin rhesus macaques among all rhesus monkey colonies surveyed in the United States, providing a unique resource for research in a naturalistic setting. The CPRC provides resources to researchers at other U.S. institutions, as well

as collaborations onsite, and it has active programs in genetics, diabetes, parasitology, behavior, cognition, and anatomy.

Vervet Research Colony: Vervets, or African green monkeys (AGMs), are critical research models due to their similarities to humans in reproductive biology, development of cardiovascular disease and type 2 diabetes on a Western diet, and growth of amyloid plaques with age. The [Vervet Research Colony \(VRC\)](#) at Wake Forest School of Medicine maintains a multigenerational, pathogen-free, genotyped colony of Caribbean-origin AGMs. The colony consists of individuals ranging in age from newborn to geriatric animals more than 30 years old. VRC animals, biospecimens, and data have contributed to research on diabetes, obesity, cardiovascular diseases, Alzheimer's disease, microbiome influences, metabolomics, and neuroscience.

NHP Antibody Resources: The [Nonhuman Primate Reagent Resource \(NHPRR\)](#) and the Neotropical Primate Reagent Resource are located at MassBiologics, a business unit of the University of Massachusetts Chan Medical School. With ORIP support, the NHPRR develops, manufactures, and distributes immune cell-depleting antibody reagents to optimize the usefulness of Old World NHPs (e.g., rhesus and pigtail macaques) in biomedical research. These reagents support research on chronic diseases, transplantation, cancer, and gene therapy. The Neotropical Primate Reagent Resource characterizes the immunoglobulin repertoire and antibody responses of New World NHPs (e.g., marmosets, squirrel

monkeys) and uses this information to engineer species-matched lymphocyte-depleting and diagnostic antibodies for New World monkeys. The resource has created several new reagents to support current studies and open new areas of research previously restricted due to lack of tools, including species-matched monoclonal antibodies. Investigators may make inquiries of, and request reagents from, both resources via the [NHPRR website](#).

The [New World Monkey Immunoreagent Resource](#) at Trinity University in San Antonio, Texas, develops mouse monoclonal antibodies to be used in novel immunoassays specific for biomarkers of inflammation and metabolism in marmosets, squirrel monkeys, and owl monkeys. Immunoreagents for such biomarkers are useful in studies of aging, neurodegenerative diseases, diabetes, metabolic syndrome, and obesity, all of which are being modeled in New World monkeys.

A neurosphere was stained to visualize nuclei (blue) and immature neural progenitors (green) transitioning to neurons (red). Image by Scott Vermilyea, Ph.D.

The [Resource for Nonhuman Primate Immune Reagents](#) at the University of Louisiana at Lafayette provides unique primate reagents and services not available commercially in support of NIH-funded investigators using NHPs as preclinical models for vaccine efficacy and immunotherapies. The resource generates novel antibody-based ligands for imaging technologies and collaborates with NHPRR in the generation of noncommercially available monoclonal antibodies to NHP cytokines.

Center for Somatic Cell Genome Editing in Nonhuman Primates: The [Center for Somatic Cell Genome Editing \(CSGE\)](#) at the University of California, Davis, provides unique, state-of-the-art capabilities for investigators to develop and test gene editing in NHPs to improve efficacy and specificity, with the aim of reducing the burden of common and rare genetic diseases in humans. Regulatory authorities currently require in-animal studies of safety, efficacy, and gene target specificity for nearly all genome-editing therapeutics under development for clinical use. CSGE assists a variety of NIH-supported programs, including the [NIH Common Fund's Somatic Cell Genome Editing program](#). CSGE currently is developing and testing novel regeneration and gene therapy tools that span a wide range of organ systems, including kidney, brain, musculoskeletal, lung, liver, heart, and hematopoietic.

In addition, the NPRCs have identified more than 80 genetic disorders within existing NHP groups, which serve as valuable disease models for treatment development and testing. Visit the [ORIP website](#) for more details on other NHP research resources.

Biospecimens Query System of the National Primate Research Centers Consortium: The Biospecimens Query System (BQS) is an informatics tool that helps investigators obtain such biological resources as tissues, serum, blood, DNA, and other materials from the NPRCs and other participating NHP facilities. The BQS allows investigators to make prospective requests or to search for existing NHP biospecimens according to NHP species, sex, age, tissue type,

and preservation method. Use of the BQS [requires registration for approved access](#).

Primate Pathology Image Database: The NPRCs' Consortium Primate Pathology Image Database (PPID) is an informatics tool that allows investigators to search for images of NHP organs and tissues based on disease name, etiology, organ, NHP genus and species, and image type. Some images are annotated, allowing the user to go directly to the anatomical region of interest. The PPID is also widely used as a learning tool by trainees in NHP clinical medicine and pathology. Use of the PPID requires [registration for approved access](#).
